SiLine HG

SiLine Software 0.24.0

The new SiLine Software 0.24.0 offers additional functions and optimises existing features. We would like to draw your attention to a few highlights.

SiLine SÜ

The handling of irregularities during initialisation has been improved. In addition, the vending machine's internal processes have been optimised to ensure more efficient execution of processes. The control sequences for the trap lock and the dispensing openings have been refined. The lift control and braking behaviour have also been optimised. The button for ECO mode located on the home page of the service menu has been removed.

Furthermore, new service codes are available for deleting product images (99M93M) and slideshow images (99M94M). The lift offset setting has been visually adjusted. In addition, the product classes have been revised. These are now also taken into account when using deals.

SW 0.24.0 includes a centred display of prices when using digital price labelling in the SiLine SÜ M.

SiLine GF

The handling of irregularities during initialisation has been improved. Furthermore, the vending machine's internal processes have been optimised. The button for ECO mode located on the service menu's home screen has been removed.

Furthermore, new service codes are available for deleting product images and slideshow images. Another service code (49M) allows the dispenser flap to be reopened.

SiLine HG

The vending machine's internal processes have been further optimised. In addition, a maximum value for the jug function can now be set directly in the vending machine's service menu. This can be found under [Vending Machine Configuration] – [General]. The button for ECO mode on the service menu's home screen has been removed.

The handling of irregularities during initialisation has also been improved. Furthermore, the customer menu now displays whether free sale is activated or the key switch has been turned accordingly.

Furthermore, the group menu of the SiLine HG TS27 has been revised. The group menu is divided into three sections. The upper section displays the available products. The section below this contains defined additions. The lower section is for the selections as they appear in the customer menu. These selections can be inserted at any point. In addition, entire groups can be deleted.

New service codes are also available for deleting product images (99M93M) and for deleting slideshow images (99M94M). The settings [Advertising Space Screen] and [Fill Mode for Selection Screens] have been moved from the service menu [Vending Machine Configuration] – [Generally] to [Vending Machine Configuration] – [Multimedia].

To use the new features correctly, existing and newly created data records must be edited and created using the current SiLine Configurator version, 1.6.0.10.

SiLine RN

The handling of irregularities during initialisation has been improved. The vending machine's internal processes have been further optimised. The display and operation of the lottery function have also been revised and optimised.

In addition, new service codes are available for deleting product images and slideshow images.
