SiLine SiOne;
SiLine HG;

SiLine Software 0.21.0

The new SiLine Software 0.21.0 comes with new functions and optimised current features. Here are just a few of the latest highlights.

We have improved internal processes.

Localisation

The Swedish display texts have been updated.

User interface

The user interface has been optimised.

Spare parts

A new display is supported as a spare part on vending machines that are already in operation.

SiLine GF

Filling level monitoring has been improved.

In vending machines with the optional heating installed, the heating temperature must be below the set cooling temperature. The heating acts as a frost monitoring system that prevents the refrigeration unit from freezing.

Optionally installed heating is switched off in energy saving mode.

SiLine SÜ

Filling level monitoring has been improved.

User interface

The diagnostics menu has been improved.

Refrigeration unit

In vending machines with the optional heating installed, the heating temperature must be below the set cooling temperature. The heating acts only as a frost monitoring system that prevents the refrigeration unit from freezing.

Energy saving mode

Optionally installed heating is switched off in energy saving mode.

Shelf look-up function

The shelf look-up function has been improved for vending machines without lift.

Sales

The sales request is repeated if the credit balance changes.

Public mode

The "public mode" function deactivates the product basket.

SiLine HG

Sold out products can be selected in the service menu of vending machines with a 7" touchscreen and a selection keypad.

Cups

The cup dispense mechanisms can be used alternately to prevent stocks of cups from ageing. This means that the cup dispense mechanisms are alternated with each sale. The cups are prevented from "ageing" as the dispensing mechanisms are active at the same time.

If the "cup theft" setting is active, the full product price is charged once the cup has been dispensed, unless the light barrier in the dispensing area detects the presence of a cup.

User interface

Different colours can be assigned to the instant product containers in order to improve clarity in regard to the recipes. The colours are used on the recipes as well.

The names of the instant product containers are found on the sub-recipes.

We have improved internal processes.

Processing of customisable product names has been optimised.

Recipes

A new entry is added to the protocol if the instant product quantity is insufficient.

Hot water and dry sugar can be configured.

The filter function has been simplified.

The recipe check has been improved.

We have improved internal processes.

Support for different languages in the product texts has been improved.

Recipe adaptation has been improved.

Advertising

Illumination of advertising spaces is controlled using the illumination time profile.

Download

The latest software version is available from the [Download centre](#) of our homepage.

Vending machine	Current software version	Installed at the factory for serial number
